

Report

1. Product Sales Dashboard

From the Product Sales Dashboard, we can find out that

- a. Most sold product is a notebook
- b. There is a sudden jump in sales in June
- c. Sales decrease in May, although the total number of products sold is increasing
- d. In all months, excluding May, the laptop is the top product by revenue
- e. AOV is decreasing till March, then rises in April, again drops in May, then rises in June.

From the above, we can conclude that the laptop is one of the major reasons why there is a sudden jump in sales in June and a decrease in sales in May.

In June, a total of 7 laptops were sold, and 1 laptop cost 55000, hence we can see a jump in sales as in another month only 1 laptop has been sold.

In May, we see a decrease in sales as no laptop has been sold, although the number of products sold was 38, which is the 2nd highest yet lowest in terms of sales, as the sales come from products like external hard drives, webcam, and Bluetooth speaker (top 3 products)

The notebooks are the most sold products, yet the revenue is driven by laptops alone.

Sr no.	Month	AOV	Product Sold	revenue
1	January	40,100	13	80,200
2	February	37,525	18	75,050
3	March	21,473	27	64,420
4	April	32,420	18	64,840
5	May	10,040	38	30,120
6	June	53,769	99	430,150

In January, only 13 products were sold, which is the lowest of all, but still got the 2nd highest AOV. The top products were Laptop, Monitor, and Headphones. Alone, these products have made 72,000 out of 80,200. Hence, fewer products were sold that were expensive.

In February, we can see a familiar thing happening. But this time, the products were laptops and printers, alone, have made 70,000 out of 75,050.

In March, 27 products sold on top products were a laptop, rice bags, and cooking oil 5L. They have made 60,400 out of 64,420. This time, only one expensive product is included i.e. A laptop which is 55,000, and the rest comes from other small products. Hence, which lowers the AOV.

In April, revenue is almost the same, and we can see the same trend, i.e., laptops are making 55,000 alone out of 64,840. But this time, products have been reduced to 18, which include a few costly products like a gaming mouse and wireless keyboard.

In May, AOV is at its lowest, i.e., 10,040, yet products were sold 38, 2nd highest. In this month, no expensive products were sold. Revenue generated is completely based on Bluetooth speaker, external hard drive, and webcam, summing up to 17,500 out of 30,120.

In June, AOV jumped to its highest 53769, with the highest products sold 99. The main reason is that the sales of laptops increased from 55,000 to 385,000.

2. Inventory Dashboard

From the Inventory Dashboard, we can find out that.

- a. The electronic category is driving revenue
- b. The Inventory has 86.42% electronic value products
- c. Stock Turnover is 7.06%
- d. There are many products that have fewer sales but more stock than required
- e. Laptop and Rice Bag are the only 2 products that are low in stock
- f. 5 products have zero sales, with 310 units sitting unused in stock

From the above, we can conclude that revenue is mainly driven by the electronic category, making 602.2K, followed by groceries, making 12.86K, and stationery, 1.62K. Even though electronics hold 86.42% of inventory value, it is making almost all of the revenue, hence stock in this category is being converted into sales efficiently. Groceries, on the other hand, hold 10.66% of inventory value, yet make only 12.86K, which is barely 2% of total revenue, hence stock here is not converting into sales the same way.

The stock turnover, i.e., 7.06%, is low because of categories like groceries and stationery, where the stock sold is very low compared to the stock quantity available. Biscuits Pack has sold 6 out of 200, Salt 1kg has sold 10 out of 200, Pasta Pack has sold 5 out of 180, USB Drive has sold 3 out of 150, Tea Pack has sold 4 out of 140, Coffee Pack has sold 4 out of 120, etc., all of these are below 5% sold, hence pulling the overall turnover down. Electronics is most probably turning over much faster, since it alone is driving almost all the revenue.

Apart from this, there are 5 products that have not sold a single unit till now, i.e. USB-C Hub, Desk Lamp, Notebook Stand, Sticky Notes Pack, and Instant Noodles Pack, summing up to 310 units sitting in stock with zero sales.

On the other side, only 2 products are in LOW stock, i.e. Laptop with 4 units left and Rice Bag with 3 units left, and these are the same 2 products that are actually driving sales, as we have seen in the sales dashboard, laptop alone is responsible for the June spike, and rice bag is one of the top selling products by quantity. Hence, the products which are selling are running low on stock, while the products which are not selling are sitting in excess.

3. Conclusion

From both dashboards, we can conclude that sales and inventory are closely connected to each other.

- a. The electronics category is making the most revenue, and laptops alone are one of the major products in this category.
- b. The months where laptop sales are high (June) or low (May) directly affect the AOV and total revenue.
- c. Laptop and rice bag are the same products that are driving sales, and these are also the ones running low in stock.
- d. Many products like biscuits pack, salt 1 kg, pasta packs, USB drives, tea packs, and coffee packs are sitting in stock but not selling much, hence pulling down the stock turnover.
- e. 5 products have zero sales, with 310 units lying unused, this stock is not contributing to revenue at all.

From the above, we can say that the products which are actually selling, i.e. laptop and rice bag, are running low in stock, while the products which are not selling much are sitting in excess. If laptops and rice bags are not restocked on time, sales might drop again, as we saw in May, but this time the reason will be no stock available, not low demand.

Electronics is converting stock into sales much better than groceries and stationery, hence revenue is mostly coming from electronics, even though its share in total inventory value is less compared to its share in revenue.

Overall, to keep growth going like we saw in June, the business needs to focus on restocking laptops and rice bags first and also needs to look into why products like

biscuits, salt, pasta, USB drives, tea, coffee, and the 5 zero sale products are not selling, as they are just sitting in stock without making any sales.

4. Suggestions

- a. Restock laptop and rice bag first, as they are the products actually driving sales.
- b. Recheck why USB-C Hub, Desk Lamp, Notebook Stand, Sticky Notes Pack, and Instant Noodles Pack have zero sales, as 310 units are sitting in stock without any sale.
- c. Reduce future stock for slow-moving products like biscuits pack, salt 1kg, pasta pack, USB drive, tea pack, and coffee pack, as all of these have sold less than 5%.
- d. Find out why electronics are performing so much better than groceries and stationery, so the same can be applied to other categories too.
- e. Keep a check on stock left for laptop and rice bag regularly, so that sales don't drop again due to no stock, like we saw happen in May due to no laptop sales.
